

CST 243-3 Rapid Application Development

Lesson 04: Web Technologies for Rapid Development

Activity 06: Session and Cookies with Java Servlets

Pre-requirements: You should complete Activity 05

Tasks:

1. Create a Servlet page that sets a cookie named user with the value Amal and an expiration time of 60 seconds. Retrieve and display the value of the user cookie to ensure you understand how to set and retrieve cookies in Servlet.
2. Develop a Servlet page that sets a cookie named visit_count to track the number of visits by a user. Increment the value of visit_count each time the page is loaded.
3. Create a Servlet page that sets a cookie named user with any value, then deletes the user cookie upon a specific action, such as clicking a button.
4. Create a Servlet page that starts a session and sets a session variable called 'username' with the value 'Amal'. Print the session variable to confirm it's set correctly.
5. Write a Servlet page that starts a session, sets a session variable email to amal@example.com, then destroys the session and attempts to access the email session variable afterward.
6. Implement a Servlet page that logout a user after 1 minute of inactivity. Start a session and set a session variable last_activity to the current timestamp. On subsequent requests, check if the current timestamp exceeds last_activity by more than 60 seconds, and if so, destroy the session and redirect the user to a login page and show a message.
